

## 4TS Finland Oy launches dSeal® real time data loggers with GPS positioning for securing assets in transit

November 15, 2007

Helsinki, Finland.

Today 4TS Finland Oy, a positioning solutions provider, launches the dSeal® product – a service concept for securing assets in transit. This world premiere solution is ideal for transport and logistics companies who emphasize quality and security in their service portfolio.

4TS dSeal® data loggers collect status information, e.g. integrity, temperature, humidity, air pressure and acceleration (shock) during transit. The data is stored in the memory card, and/or transmitted over the GPRS network to a 4TS dMonitor™ online server, where the information is presented graphically together with the time code and GPS coordinates of each event. This aids in managing the transport conditions within given tolerances, improving service quality and the security of the assets. 4TS dSeal® data loggers can be configured dynamically to monitor any combination of prevailing conditions.

Jyrki Paananen, CEO and President of 4TS Finland Oy: “By using 4TS dSeal products companies can be sure that their packages are not opened or handled incorrectly during delivery or storage. This enables logistics companies to provide their customers with a new kind of low cost, secured and high quality delivery service. With 4TS dSeal products logistics companies can easily prove to their customers that their confidential, valuable or sensitive deliveries haven’t been compromised during transport or storage. “

4TS dSeal® real time data loggers will start shipping in Q1 2008.
